Source Files & Extraction Method

Every figure in this report is traced to the file and line it was read from, on the data-sources sheet that follows its page. This page lists the files behind all of them. Figures printed as — were in none of the files supplied for this period; the reason is stated against each one. Values marked **OCR** were recovered from a scanned page by vision OCR rather than read from machine-readable text, and warrant a closer look.

How to Read These Working Papers

Each data-sources sheet states, for every figure on the page before it, how that figure was obtained. This page defines the six markers it uses and the arithmetic conventions applied throughout the report.

HOW WE GOT IT

THE SIX MARKERS USED ON EVERY DATA-SOURCES SHEET

● Extracted	Read directly from a supplied file. The sheet names the file, the worksheet or page, the row, and quotes the source line it was read from.
○ Extracted by OCR	The page carried no machine-readable text, so it was transcribed from an image by vision OCR before being read. Transcription confidence is stated. These warrant a closer look than the rest.
● Calculated	Derived from other figures in this report. The sheet gives the formula in full, with each input value and the file and row it came from.
● Entered by reviewer	Typed on the review screen, either because no file carried it or because the extracted value was corrected.
● AI-written	Narrative prose drafted from the figures above it, for a reviewer to check. No number is ever produced this way.
● Not found	In none of the files supplied for this period. The sheet names the document that would ordinarily carry it. Nothing is estimated or inferred to fill the gap.

CALCULATION CONVENTIONS

APPLIED TO EVERY CALCULATED FIGURE

Precision	Every calculation runs at full precision on the extracted values and is rounded once, for display only. An intermediate result is never rounded and fed into the next step.
Rounding	Half away from zero: 1,424.5 prints as 1,425 and -162.5 as -163. This is the convention of financial statements and of Excel's ROUND, rather than the half-to-even default of most programming languages.
Percentage change	Divided by the prior-period value, never by the current one.
Variance	Actual less budget. On expense lines the sign is inverted so that a favourable result reads positive; the data-sources sheet says so against each line it applies to.
Reading a difference	Because operands are rounded for display only, a printed difference can differ by one unit from subtracting the two printed figures. Where they differ, the printed difference is the more accurate of the two.
